ABSTRACT

The use of internet network can be access everywhere in the world. The trend in sharing and get the latest information with the ability and effectively have encouraged in development of networking especially in internet network to make it more effective. Because of this, one system is developed to overcome the weaknesses of the current system which is now done manually. The main objectives of this system are to store all information about student’s attendance, student’s profile and also the student’s discipline. The system can manipulate the data based on student’s attendance, analyze the student’s discipline and explain it using pie chart. It also can generate the warning letter to give to the student or their parents. The system is developed using the World Wide Web (WWW) services and PreHypertext Processor (PHP) programming with the MySQL as the database to access the request data. The method that was use in this system is Unified Modeling Language (UML). The database is used to store the entire student’s information which is related on the student’s attendance, and discipline. Hopefully, this system will replace the manual system and help the organization very well.
